

USAN Configuration Manager

On-Demand Change Management for Amazon Connect

USAN Configuration Manager for Amazon Connect is a powerful portal that provides Connect business users the flexibility to deploy real-time configuration changes. The ability to make contact center brand, configuration, and emergency maintenance changes are available on-demand without coding and under full change management.

The portal offers maximum flexibility and security by providing role-based users with the ability to change and control all data-driven call flow attributes through an easy-to-use table interface. Changes and updates can be tested in a development, or UAT environment prior to production deployment and then scheduled to take effect immediately or at specific future dates and times. A complete audit history is available for all changes if needed and maintenance windows may be defined to constrain deployment. A flexible table-driven design supports changes to hierarchical branding and conditional call treatments that provide the ability to quickly react to business changes and manage event-driven messaging. New call flows can be created with limited technical/development support. The tool supports the ability to create metafile definitions that mistake-proof tables by categorizing table values and rules.

Flexible Configuration Tool

- Modifications to contact center business logic can be easily and safely deployed by business users
- Changes can be rolled back instantly to prior state if needed
- Audit trails are created for analysis or audit documentation
- Conditional routing adjustments are made to address events and environmental changes
- Functional features such as turn on/off call backs are created based on business rules/conditions
- Configuration Manager portal can be configured as a fully managed service
- On-demand event driven changes can be quickly deployed across multiple flows
 - Emergency messages
 - Scheduled holiday messages
 - Branding messages
 - Notification messages
